

## Lee de Forest - Audion

Electronic Music Inquiry Unit

United States. On 25 October 1906 Lee de Forest submitted a patent application on a "Device for amplifying feeble electrical currents", which included the first form of the 3-electrode Audion. The device and its later improvements became the standard, allowing for inexpensive amplification of wireless voice signals among other amplification uses - including electronic instruments. It remained in widespread use until replaced by the transistor.
